### **5 lbs. 4oz. MICROBE-LIFT High Growth & Energy**

In the late spring when the warmer temperatures arrive, koi and goldfish need a boost of protein for growth since they have depleted their fat reserves over the winter. In the fall, a higher protein diet is also required since pond fish need to bulk up in preparation for their winter fast. Use this feed at a minimum temperature of 68°F (20°C). Pond fish really start to grow at this temperature. You can use MICROBE-LIFT® LEGACY Growth & Energy Food up to four times per day. Feed between 2-3% of the fishes' body weight per day.
